30 October 2026 snapshot | 30-day window | 125 builder codes / 122 companies

Builder fees and trader profitability

1. The same wallet profit appears under several builders

2,056 shared wallets. Every overlapping wallet has identical perps PnL across its builder records. Adding company totals counts some account results more than once.

Wallet PnL covers the account; it does not identify which builder routed the profitable trades.

2. One wallet can change a company from profit to loss

19 of 120 signs reverse. Removing the largest absolute-PnL wallet reverses these company totals. The median company has 90.1% of absolute PnL in its ten largest wallets.

Use median wallet PnL and win rate alongside these stress tests. Small samples remain fragile.

3. Builders collect fees while observed accounts lose money

$10.33m in fees. Unique observed wallets gained $34.54m and lost $135.47m: $100.93m net losses across their accounts.

Fees are builder-specific; account losses include other routes. This comparison does not establish that builders caused the losses.

Which types have the most profitable traders?

Wallet has the most profitable wallet-company observations (14,921). Trading app leads by wallet rate (28.33%); Terminal & analytics leads by profitable share of all observed routed volume (31.62%). Terminal & analytics also has the least-negative account PnL per routed dollar (-0.0572%). Every type has a negative aggregate account PnL. These comparisons cover the 30 classified companies.

What to distrust

- **Attribution:** The paginated historical API sample returned 196/204 usable wallet comparisons; 118/125 multi-builder wallets were usable. Their median largest-builder share was 70.28% of returned exchange fill volume; the median combined selected-builder share was 94.57% and the pooled volume share was 67.55%. The 2,000-fill response cap was handled by pagination. Coverage is unverified and these ratios cannot allocate PnL. Deduplicate wallets for account totals; builder attribution requires matched trade routing and PnL.
- **Whale-driven totals:** removing ten wallets reverses 16/113 eligible company signs. Prefer median wallet PnL and win rate, with sample size and both exclusion tests.
- **Source agreement:** Atomic wallet volume is 10.46% below its leaderboard total; Outcome wallet fees are 5.65% above reported revenue. There are 111 missing and 4,475 zero-PnL rows. Zero and missing PnL are excluded from wallet win rates, but their volume stays in the volume-share denominator; missing PnL is not assumed to be a loss.
- **Product claims and causation:** labels have linked evidence and confidence; four ambiguous types retain user decisions. Products, trader selection and market conditions differ. No result shows that a product type causes profits.

Source: supplied HyperTracker data; label evidence; methods and four answers; data checks. Perps PnL only; volume and fees use leaderboard totals. This private assignment report contains no individual wallet records.
